## Generator

\* "... composed of concatenated 3x1, 9x1, 27x1, 81x1 filters"

Leaky ReLU vs PReLU:  $f(x) = \begin{cases} x & x > 0 \\ \alpha x & x \leq 0 \end{cases}$   
 $\alpha$  is hyperparam  $\alpha$  is param

=> weird pattern, problem w/ skip connections?

all 128x8 connected to 1?

Autoencoder: Generator without skip connections

get the features at the bottleneck

Put true data and generated data in autoencoder.

train like the GAN, only 4 levels
